Abstracts

Transfer molding services refer to a manufacturing process and related service activities that use transfer molding technology to produce plastic or composite products. This process is widely used in industries requiring high-precision and complex structural components. Transfer molding is a method that transfers pre-melted materials into a mold cavity through a runner system for curing and forming. The core process includes:

1. Material Preparation: - Prepare thermosetting plastics (e.g., epoxy resin, phenolic resin) or composite materials (e.g., glass fiber-reinforced plastics), often in the form of pellets, powders, or preforms.
2. Melt and Transfer: - Place the material into a "transfer pot" (a chamber above the mold), heat it to a molten state, and use a plunger to push the material through a runner and gate system into the closed mold cavity.
3. Curing and Forming: - The material undergoes a chemical reaction (thermosetting) or cooling (thermoplastic) in the mold to solidify into the desired shape.
4. Demolding and Post-Processing: - Open the mold to remove the product, and perform trimming, deburring, or surface treatment as needed.
