Abstracts

Transformers are used in oil and gas drilling mainly to provide the required voltage and current to support the operation of various electric equipment and tools. The function of the transformer is to increase or decrease the voltage of the current to meet the power requirements of different equipment on site. In the process of oil and gas drilling, a large amount of electrical energy is often required to drive equipment such as drilling rigs, mud pumps, compressors, etc. Since the power supply at the drilling site may be unstable or the voltage level may not match, the use of transformers can ensure that the equipment can operate stably and improve overall work efficiency.
