Abstracts

Transformer insulating oil, also known as dielectric insulating oil or power transformer oil, is a highly refined mineral or synthetic oil specifically engineered for use in electrical power transformers, circuit breakers, and other high-voltage equipment. Its primary function is to serve as both an electrical insulator and a cooling medium, preventing electrical discharges between conductive components while dissipating heat generated during transformer operation. Additionally, it helps preserve the integrity of cellulose-based insulation materials, suppresses corona discharge, and allows for dissolved gas analysis (DGA) to monitor equipment health. Key properties include high dielectric strength, thermal stability, low viscosity, oxidation resistance, and minimal moisture content to ensure reliable performance under extreme electrical and thermal stresses over extended operational lifetimes.

The global Transformer Insulating Oil market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
