Abstracts

Transformers for Nuclear Power refers to the specialized transformers used in nuclear power plants to support the generation, transmission, and distribution of electrical power. It mainly includes main transformer, standby transformer and other transformers. Compared with traditional 35kV transformers, 66kV liquid-immersed transformers can extend the transmission distance, improve energy transmission efficiency and system reliability, while reducing cable length, transmission loss and fault maintenance risks. A single large-capacity wind turbine matched with a 66kV large-capacity wind power transformer can reduce the number of wind turbines required for the overall project, reduce construction and operating costs, and help improve the profitability and sustainable development of wind power projects.

The global Transformers for Nuclear Power market size was estimated at USD 1190.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.00% during the forecast period.
