Abstracts

Transient Fault Recorder (TFR) is a specialized device used in electrical power systems to capture and record temporary or transient faults that may occur in the system. These faults are often short-lived and can be difficult to detect using traditional monitoring methods. The TFR is capable of capturing high-speed data, typically in the microsecond range, which allows it to accurately record the characteristics of the fault, such as its magnitude, duration, and frequency. This information is crucial for diagnosing the cause of the fault, assessing the severity of the impact on the power system, and developing strategies to prevent future occurrences. The TFR is an essential tool for maintaining the reliability and stability of electrical power systems.

The global Transient Fault Recorder market size was estimated at USD 742.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
