Report Overview

Transit-time ultrasonic flowmeter is an instrument that uses ultrasonic technology to measure the flow of liquid or gas. It determines the velocity and flow rate of a fluid based on the velocity and time difference of sound waves propagating through the fluid.

Transit-time ultrasonic flow meters usually consist of two ultrasonic sensors, one as a transmitter and the other as a receiver. The transmitter emits an ultrasonic signal which is picked up by the receiver after passing through the fluid. By measuring the propagation time difference or frequency change of the ultrasonic signal, the flow velocity and flow rate of the fluid can be calculated. Transit-time ultrasonic flowmeters have the advantages of non-invasiveness, no pressure loss, and the ability to measure various liquids and gases. They are suitable for various pipe sizes and fluid media, and can be used in a wide range of industrial and commercial applications, such as water supply systems, chemical plants, energy industries, environmental monitoring, etc.
