The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Transition Piece (TP) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Transition Piece (TP) is a critical component in offshore wind turbines, acting as a connecting structure between the foundation, typically a monopile, and the turbine tower. Made from steel pipe construction, the transition piece ensures structural stability by securely linking the monopile to the tower through bolted or grouted connections. It also houses essential elements such as platforms, ladders, and boat landing systems, which enable technicians and engineers to safely access the turbine for maintenance and repair tasks. These robust pieces are vital for the operational integrity of offshore wind farms, facilitating both the connection and accessibility needed for efficient turbine function. About \$161 million for the transition pieces for a 1 GW wind farm using monopile foundations.

The global Transition Piece (TP) market size was estimated at USD 1570.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
