Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Translaminar Control Agents competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Translaminar control agents are a type of active ingredient that has the ability to penetrate the surface of leaves and are commonly used in pesticides, especially in the field of fungicides and insecticides. Their characteristics are that after the agent is sprayed on one side of the leaf, it can penetrate the mesophyll cell layer and reach the other side of the leaf, thereby providing a double-sided protection effect for the entire leaf surface, even if the pathogens or pests are located on the back of the leaf that is not directly in contact with the agent. This type of control agent is both local and systemic, and is often used to control target pests and diseases such as fungal leaf spot, powdery mildew, and aphids. Compared with traditional contact agents, translaminar control agents have a longer-lasting control time and a higher utilization rate of drug efficacy, and are increasingly valued in modern precision agriculture and efficient crop protection programs.

The global Translaminar Control Agents market size was estimated at USD 1875.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
