Abstracts

Translation Memory (TM) software is a tool used in the translation industry to enhance efficiency and consistency in translating text. It works by storing previously translated segments, such as phrases, sentences, or paragraphs, in a database. When a new text is translated, the software checks the database for any matches or partial matches to the new text, and suggests those translations to the translator. This allows for faster translation of repetitive or similar content while maintaining consistency across projects. TM software is particularly useful for translating technical documents, legal contracts, websites, and other content with frequent repetitions.

The global Translation Memory Software market size was estimated at USD 626.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
