Abstracts

Transmission electron microscopy (TEM) is an imaging technology in which electron beams pass through very thinly sectioned specimens. As the electrons are transmitted through the specimen and interact with its structure, an image resolves that is magnified and focused onto an imaging medium, such as photographic film or a fluorescent screen, or captured by a special CCD camera. Because the electrons used in transmission electron microscopy have a very small wavelength, TEMs can image at much higher resolutions than conventional optical microscopes that depend on light beams. Due to their higher resolving power, TEMs play an important role in the fields of virology, cancer research, the study of materials, and in microelectronics research and development.

The global Transmission Electron Microscope Tem market size was estimated at USD 765.32 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
