## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Transmission Line Deicing Robot competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The transmission line deicing robot is an intelligent device used for automatic deicing of high-voltage overhead transmission lines. It has the ability to autonomously walk on the conductors, identify the degree of ice coverage and perform deicing tasks. Its main structure includes a walking mechanism, an intelligent control system, a deicing execution unit (such as mechanical vibration, electric heating, pulse discharge or high-frequency impact device), a sensor recognition system and a remote communication module. The robot can be remotely controlled or operated autonomously, adapt to harsh environments such as high altitude, severe cold, and complex terrain, and effectively improve the safe operation level of the power grid in ice and snow disasters. It is widely used in areas where ice disasters frequently occur, ultra-high voltage lines, and unmanned line sections. It is one of the important development directions of automation and intelligence in current power operation and inspection.

The global Transmission Line Deicing Robot market size was estimated at USD 338.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
