Abstracts

Transpiration inhibitors are agricultural products designed to reduce water loss in plants by forming a protective barrier on leaf surfaces or by affecting the stomatal closure mechanism, thereby mitigating water stress and improving water use efficiency in crops, particularly in arid or drought-prone regions. These products, which can be synthetic compounds like antitranspirants or natural substances such as certain polymers and waxes, are applied to foliage to limit excessive transpiration without significantly impeding photosynthesis or gas exchange, offering a practical solution for conserving soil moisture, enhancing crop resilience, and stabilizing yields under water-scarce conditions.

The global Transpiration Inhibitor market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
