## Abstracts

A transseptal guiding sheath is a specialized medical device used in interventional cardiology and electrophysiology procedures to facilitate access to the left atrium of the heart via a transseptal puncture. It consists of a long, flexible catheter with a reinforced, atraumatic tip, designed to be advanced over a transseptal needle through the femoral vein, inferior vena cava, and right atrium, ultimately crossing the interatrial septum. The sheath provides a stable conduit for the delivery of diagnostic or therapeutic tools?such as ablation catheters, mapping systems, or closure devices?while minimizing trauma to cardiac structures and ensuring precise positioning during complex interventions like atrial fibrillation ablation, left atrial appendage closure, or mitral valve procedures. Its design often incorporates features such as curvature memory, radiopaque markers, and hemostatic valves to enhance procedural safety, efficiency, and compatibility with imaging modalities.

The global Transseptal Guiding Sheath market size was estimated at USD 330.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
