Abstracts

Transvaginal endoscopy is a minimally invasive diagnostic and therapeutic procedure that involves the insertion of a specialized endoscope through the vaginal canal to visualize and access the female reproductive organs, including the cervix, uterus, fallopian tubes, and ovaries. This technique allows for direct examination, biopsy, and surgical intervention, such as the treatment of adhesions, polyps, or infertility-related conditions, with reduced patient trauma, shorter recovery times, and lower risk of complications compared to traditional open surgeries. The procedure is often integrated with hysteroscopic or laparoscopic approaches to provide a comprehensive assessment of gynecological health, making it a valuable tool in both diagnostic evaluations and operative gynecology.

The global Transvaginal Endoscopy market size was estimated at USD 38.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
