Abstracts

A transversal hemming line refers to an automated industrial sewing system specifically designed for hemming operations performed perpendicular to the fabric grain, commonly used in textile and apparel manufacturing for finishing edges on items like towels, bedsheets, napkins, and garments. These systems integrate feeding, folding, stitching, and cutting mechanisms to achieve high-speed, uniform hemming with minimal manual intervention, often incorporating programmable logic controllers (PLCs) and sensors for precision and consistency. The technology is essential for mass production environments where efficiency, repeatability, and seam quality are critical, and it may include features such as adjustable stitch patterns, variable speed controls, and compatibility with different fabric types.
