## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Trapped-Ion Quantum Computer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A trapped-ion quantum computer is a type of quantum computing system based on the principles of quantum mechanics, utilizing charged atoms (ions) as qubits. These ions are captured and suspended in a vacuum within an ion trap by electromagnetic fields (such as radiofrequency fields or lasers), maintaining high isolation to reduce environmental noise interference. The state of the qubits is encoded by the internal electronic energy levels of the ions (such as hyperfine levels), with quantum logic gate operations and quantum state manipulation achieved through precisely controlled laser pulses. Quantum entanglement between ions is typically realized throughomb interaction and shared vibrational modes, enabling multi-qubit operations. Trapped-ion quantum computers stand out for their superior advantages in qubit stability, precise control capabilities, scalability, and broad application prospects.

The global Trapped-Ion Quantum Computer market size was estimated at USD 118.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.00% during the forecast period.
