Abstracts

Mobility simulation test development services involve building virtual environments and high-precision models to simulate and test various travel scenarios, vehicles, and traffic participant behaviors. These services cover a wide range of areas, including autonomous driving, intelligent transportation, traffic safety, and vehicle control strategies. This service integrates multi-physics simulation, artificial intelligence, big data analytics, and software engineering technologies to provide full-process support for OEMs, transportation planning agencies, and technology companies, from virtual scenario construction, behavior modeling, algorithm verification, to hardware-in-the-loop (HIL/SIL) testing. This effectively reduces development costs, improves testing efficiency, and ensures the safety and reliability of mobility systems. This service plays a particularly critical role in the development and deployment of autonomous driving systems and intelligent transportation systems. Customers primarily use this service to virtually verify and optimize vehicle performance, autonomous driving algorithms, ADAS systems, safety, and road traffic scenarios, thereby reducing real-world testing costs, shortening R&D cycles, and improving product safety and reliability. Furthermore, urban traffic management departments and smart transportation platforms also use simulation testing to evaluate traffic flow, signal control, and road planning solutions. This supports the planning and decision-making of intelligent transportation systems, achieving a more efficient and safe travel environment. The gross profit margin for travel simulation testing and development services is 72%. As a crucial support tool for smart mobility and the digital transformation of the automotive industry, travel simulation testing and development services are becoming a key component in improving R&D efficiency, reducing costs, and ensuring traffic safety. With the rapid development of autonomous driving, new energy vehicles, and intelligent connected technologies, the traditional model of relying on real-world road testing is facing challenges such as high costs, long cycles, and significant safety risks. Simulation testing, through virtual environments,

digital twins, and high-precision models, enables comprehensive verification and optimization of vehicle dynamics, sensor systems, autonomous driving algorithms, and complex traffic scenarios under safe and controllable conditions. This service not only accelerates the development and iteration of new vehicle models and technologies, but also provides data-driven decision support for urban transportation planning and smart traffic management, improving road efficiency and safety. Furthermore, with increasing computing power, intelligent simulation software, and the establishment of standardized testing frameworks, travel simulation testing and development services are gradually evolving towards automation, real-time capabilities, and richer scenarios, becoming a core technical enabler for automakers, mobility platforms, and public transportation authorities to achieve sustainable, efficient, and intelligent mobility.

The global Travel Simulation Test Development Service market size was estimated at USD 1203.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.10% during the forecast period.
