Report Overview

Tray type deaerator is a vertical dome placed on the horizontal section of the vessel. The basic difference between a tray-type and spray type is in Tray type both a spray nozzle and trays are used. By using both spray and tray mixing up of air and water is more (heat exchange takes place more properly). By this, the dissolved gases present in the feed water will be eliminated more precisely. Thus, the boiler efficiency can be enhanced more. The boiler feed water fed to the tray type deaerator is sprayed onto the trays using the perforated nozzles. The internal steam distributing pipe supplies the low-pressure steam into the vessel. The water sprayed on to the trays mixes up with air and water at high temperatures. At this temperature, unwanted gases will be eliminated. The water free from the dissolved gases is collected in the vessel at the bottom. This water is fed to the boiler from the deaerated section via a pump.
