Abstracts

Trench structure silicon carbide (SiC) MOSFETs represent a specific category of power semiconductor devices that combine the superior material properties of silicon carbide—including high thermal conductivity, high breakdown electric field strength, and high operating temperatures—with a trench gate architecture, which reduces on-resistance ($R_{DS(on)}$) and gate charge to enhance switching efficiency and power density. These devices are engineered to handle high voltages, high frequencies, and elevated temperatures more effectively than traditional silicon-based power transistors or planar SiC MOSFETs, making them particularly well-suited for demanding applications such as electric vehicle powertrains, renewable energy inverters, industrial motor drives, and high-efficiency power supplies where minimizing energy loss and maximizing thermal performance are critical.

The global Trench Structure Sic Mosfets market size was estimated at USD 1045.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
