Abstracts

A tri-lobe roots blower is a type of positive displacement rotary blower that uses two rotors, each with three lobes, to move air or gas. It's widely used in various industrial applications, particularly where a steady flow of air or gas at low pressure is needed.Improving efficiency and reducing energy consumption are the main development trends of Roots blowers. The impeller is the core component of the Roots blower. The change in the cross-sectional shape of the impeller has a significant impact on the air volume, energy consumption and noise of the blower. The energy consumption can be well reduced by optimizing the design of the impeller.Increasing the speed is one of the important ways to miniaturize the blower, which can achieve obvious effects of reducing volume and weight while improving efficiency. However, increasing the impeller speed has higher requirements for the impeller material, sealing system, bearing system and rotor stability of the Roots blower, which is a problem that needs to be studied and solved in the development process of the Roots blower.The noise of the Roots blower is one of the sources of noise pollution in industrial production. The noise of the fan is mainly aerodynamic noise. The noise problem of large Roots blowers is prominent. Its speed is low, the noise frequency is low, the wavelength is long, and it is not easy to block and eliminate. At present, the research on silencing and noise reduction of Roots blowers is constantly deepening, such as the design of various air outlet shapes of the casing, the use of backflow silencing, resonance silencing, etc.With the continuous expansion of the scale of various industrial devices, the requirements for production process control have developed from the past single working condition parameter control to multiple working condition parameter control to better meet the requirements of the production process. Using PLC, single chip microcomputer or PC can effectively control the various operating parameters of the blower, automatically adjust the operating parameters of the blower in real time according to the changes in the working condition parameters to meet the requirements

of the process, and can protect the safe operation of the blower by monitoring parameters such as pressure, temperature, vibration, etc.
