Abstracts

The three-temperature test handler is a multi-environment adaptability testing and sorting equipment designed specifically for integrated circuits. Its core lies in dynamically switching between three temperature conditions: high temperature, normal temperature, and low temperature, combined with electrical performance testing and mechanical sorting functions, to achieve reliability screening of devices under different thermal stress scenarios. With the increasing complexity of semiconductor devices and the differentiation of terminal application scenarios, test handlers, as the "efficiency engine" of chip packaging and testing, are undergoing a leapfrog upgrade from single-station, normal temperature testing to multi-station, three-temperature (low temperature, normal temperature, high temperature) testing. According to QYResearch statistics, the global test handler market size will reach US\$2.3 billion in 2024, and is expected to reach US\$4.95 billion by 2030, with an annual compound growth rate of 11.5%. The growth of this data reflects the urgent need for chip full-temperature reliability verification in high-reliability fields such as automotive electronics, industrial control, and data centers. Traditional test handlers are mainly 2-4 stations, only supporting normal or normal high temperature environments, and it is difficult to meet the large-scale mass production needs of advanced chips. In recent years, leading manufacturers have achieved the simultaneous expansion of the number of stations and temperature control range through mechanical structure optimization, temperature control algorithm iteration, and data stream parallel processing technology. In addition to the three-temperature test handler, there are also normal high temperature models and normal temperature models. From the cost perspective, the three-temperature test handler has the highest price. At the same time, under the same model, the more test stations there are, the higher the price. In terms of enterprises, Chinese local manufacturers have achieved the localization of three-temperature test handlers. Mainstream companies include Hangzhou Changchuan, Jht Design Co, etc. It is expected that by 2030, the

localization rate of China's semiconductor equipment will increase to more than 65%.

The global Tri-Temp Handler market size was estimated at USD 715.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.60% during the forecast period.
