Report Overview:

Triangulation Laser Displacement Sensors are comprised of a light-emitting element and a position sensitive detector (PSD) and detect targets using triangulation. A semiconductor laser is used as the light emitting element. A lens focuses the beam on the target. The target reflects the beam back through the lens where it is focused on the position-sensitive detector (PSD), forming a beam spot. The beam spot moves as the target moves. Displacement can be determined by detecting the movement of the beam spot.

The Global Triangulation Laser Displacement Sensors Market Size was estimated at USD 1511.69 million in 2023 and is projected to reach USD 2332.99 million by 2029, exhibiting a CAGR of 7.50% during the forecast period.
