Abstracts

Triangulation ranging lidar is a lidar system that projects a laser beam onto the surface of a target object and uses the change in reflected light and laser emission angle to calculate the distance. Its working principle is based on the change in the angle of the radar signal reflected from the surface of the object, and the precise distance of the target object is calculated through the principle of optical triangulation. Triangulation technology is usually extremely accurate and suitable for measurement applications with short distances or high precision requirements. Common triangulation LiDARs have high spatial resolution and can provide detailed three-dimensional data to related systems, accurately building a three-dimensional model of the surrounding environment by calculating the distance to the target object. Typical triangulation LiDARs include systems that use infrared or visible light wavelengths, which are generally suitable for smaller ranges and high-resolution close-range applications.

The global Triangulation Ranging LiDAR market size was estimated at USD 342.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
