Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Triazine Charcoal-forming Agent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Triazine Charcoal-forming Agents are char-forming agents used in halogen-free intumescent flame retardants for polyolefin materials. Their primary function is to form a dense char layer upon high-temperature decomposition, thereby achieving a flame-retardant effect. Compared to traditional char-forming agents, they offer advantages such as high flame retardancy, high water resistance, excellent thermal stability, low toxicity, environmental friendliness, and a lack of precipitation, effectively improving the heat resistance of plastics. Global production in 2024 is expected to be approximately 12,000 tons, with an average selling price of US\$4,500 per ton. The raw materials for triazine charcoal-forming agents are primarily melamine and other chemical reagents, such as hypophosphorous acid, diethanolamine, and formaldehyde. Through various chemical reactions, a flame-retardant charring agent containing a triazine structure is produced. Melamine is a key precursor for the synthesis of certain triazine charcoal-forming agents. Global manufacturers include OCI Global, Borealis, and Mitsui Chemicals. Downstream, flame-retardant material processing and application industries include polyolefins, epoxies, polyurethanes, engineering plastics, and building materials, ultimately finding applications in the electronics, automotive, and construction sectors.

The global Triazine Charcoal-forming Agent market size was estimated at USD 54.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
