## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Tricalcium Phosphate Bioceramics (TCP) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Tricalcium phosphate bioceramic (TCP) is a biomedical material with calcium phosphate as the main component, and has a chemical composition that is highly matched with the inorganic salt components of human bone tissue. As a third-generation bioactive ceramic, TCP has both biological activity and controllable degradability. After implantation into the human body, TCP can chemically bond with the host bone by forming a bone-like hydroxyapatite layer on the surface, while gradually degrading during the bone regeneration process, achieving a "one-up, one-down" effect of bone repair, and is widely used in the field of bone defect repair and tissue engineering.

The global Tricalcium Phosphate Bioceramics (TCP) market size was estimated at USD 205.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
