Abstracts

Triethoxy(octyl)silane is a silane coupling agent characterized by its organic-inorganic hybrid structure, featuring an octyl group (C₈H₁₇) attached to a silicon atom bonded to three ethoxy groups (OC₂H₅). This molecular design enables it to function as a surface modifier, where the hydrolyzable ethoxy groups react with inorganic substrates (such as glass, metals, or minerals) to form stable covalent bonds, while the hydrophobic octyl chain extends outward, imparting water repellency, improved adhesion, and compatibility between organic polymers and inorganic materials. It is widely utilized in coatings, sealants, composites, and construction materials to enhance durability, moisture resistance, and interfacial performance.

The global Triethoxy (Octyl) Silane market size was estimated at USD 127.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
