Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Trifocal IOL competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A trifocal intraocular lens (Trifocal IOL) is an advanced premium implant used in cataract surgery to provide clear vision at long, intermediate and near distances. It features diffractive optical zones designed to minimize dependence on glasses and enhance daily visual performance. In 2024, the global average price of trifocal IOLs is around US\$780 per unit, with worldwide usage reaching approximately 3.4 million units. Gross margins typically range from 45%?65%, driven by precision lens manufacturing, hydrophobic acrylic materials, surface coatings, and strict clinical performance standards. The supply chain includes upstream optical-grade acrylic polymers, diffractive mold technology, polishing equipment and sterilization packaging; midstream manufacturers handle lens modeling, diffractive structure processing, edge design, surface finishing and quality testing; downstream users include eye hospitals, cataract surgeons, refractive clinics and medical distributors. Trifocal IOL stands for Trifocal Intraocular Lens. It is a type of intraocular lens that is implanted into the eye during cataract surgery or as a treatment for presbyopia. Trifocal IOLs are designed to provide patients with clear vision at multiple distances, including near, intermediate, and far. This means that patients who receive trifocal IOLs are less likely to require the use of glasses or contact lenses for most daily activities, such as reading, using a computer, and driving.

The global Trifocal IOL market size was estimated at USD 2653.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.40% during the forecast period.
