Abstracts

Trifocal lenses are eyeglass lenses designed with three distinct focal areas to correct farsightedness, intermediate vision, and nearsightedness. The lens is divided into three sections: the upper part for distance vision, the middle part for intermediate vision (such as for computer work or daily activities), and the lower part for near vision (such as reading). The inclusion of the intermediate zone makes trifocal lenses ideal for individuals with presbyopia, offering a continuous range of vision from near to far. However, trifocal lenses have visible transition lines between the different zones, which may cause some discomfort for wearers as they adjust.

The global Trifocals Lenses market size was estimated at USD 89.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
