Abstracts

A trihedral corner reflector is a passive radar device composed of three mutually perpendicular, intersecting flat surfaces, typically constructed from metal or metallized materials, that efficiently reflects electromagnetic waves back to their source regardless of the angle of incidence. This property makes it highly valuable for applications requiring consistent radar signature enhancement, such as in marine navigation aids, aviation safety systems, calibration of radar equipment, and military deception or target simulation. The device operates on the principle of retroreflection, ensuring that incoming radar signals are returned along the same path they arrived, thereby maximizing detectability by radar systems. Its performance is characterized by a large radar cross-section relative to its physical size, dependability across a wide range of frequencies and environmental conditions, and minimal maintenance requirements due to the absence of active components.

The global Trihedral Corner Reflector market size was estimated at USD 125.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
