Abstracts

Trimetazidine hydrochloride is a clinically established antianginal medication that functions as a metabolic modulator rather than a conventional hemodynamic agent. It operates by selectively inhibiting the enzyme 3-ketoacyl coenzyme A thiolase, thereby shifting cardiac energy metabolism from fatty acid oxidation to the more oxygen-efficient glucose oxidation, which helps maintain cellular homeostasis and energy production during ischemic conditions. This mechanism reduces the frequency of angina attacks, improves exercise tolerance, and minimizes the need for nitrate use, without significantly affecting heart rate or blood pressure, making it particularly suitable for patients with contraindications to standard antianginal therapies. Marketed under various brand names globally, it is available in both immediate-release and modified-release formulations, and is often used as an adjunct therapy in the management of stable angina pectoris, especially in cases where first-line treatments are insufficient or poorly tolerated.

The global Trimetazidine Hydrochloride market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
