The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Triple-effect Falling Film Evaporator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A triple-effect falling film evaporator is a device that uses multiple sets of evaporators to evaporate and concentrate a solution. It achieves high efficiency and energy saving by using the secondary steam generated in the previous effect as the heat source for the next effect. It completes the concentration process by causing the liquid to fall as a thin film along the inner wall of the heat exchange tubes and be heated and vaporized. The upstream mainly includes basic equipment such as stainless steel sheets, alloy pipes, welding and sealing materials, automatic control components, sensors, and pumps and valves. The quality, corrosion resistance, and processing precision of these raw materials directly affect the reliability and service life of the equipment. Downstream applications are mainly in the food, bioengineering, pharmaceutical, and chemical industries. Global sales in 2024 were approximately 3,500 units. Equipment prices are affected by factors such as processing capacity, evaporation rate, material composition, whether it includes an MVR system, degree of automation, and degree of customization. The average price per unit ranges from US\$20,000 to US\$80,000. The industry gross profit margin is between 15% and 30%.

The global Triple-effect Falling Film Evaporator market size was estimated at USD 80.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
