Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Triple-layer Insulated Wire for Servers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Triple-layer insulated wire for servers is a high-performance insulated conductor designed specifically for server switching power supply transformers. Its unique three-layer insulation structure provides the highest reinforced insulation rating and can withstand withstand voltage tests up to AC 3000V. This wire helps reduce transformer size and weight. Its excellent insulation properties eliminate the need for interlayer insulation tape during transformer winding, simplifying the production process and improving server power density and reliability. Global sales of triple-layer insulated wire for servers are expected to reach 1.5 billion meters in 2024, with an average selling price of US\$51 per kilometer. The upstream of its industry chain primarily supplies conductor materials (such as bare copper and tinned copper) and specialty insulation materials (such as ETFE, FEP, and PFA). The midstream involves the design, manufacturing, and quality control certification of three-layer insulated wire, involving processes such as wire drawing, insulation extrusion, and lamination. These products must pass stringent safety certifications such as UL and VDE. Downstream, high-frequency transformer windings used in server power supply units are critical foundational materials for ensuring the stable operation of core power conversion components in data centers.

The global Triple-layer Insulated Wire for Servers market size was estimated at USD 76.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
