Abstracts

Triple quadrupole ICP-MS (inductively coupled plasma mass spectrometry) is an advanced analytical instrument used for ultra-trace elemental and isotopic analysis, particularly in complex sample matrices where spectral interferences would otherwise compromise accuracy. It combines a high-temperature plasma source with three quadrupole mass filters in a tandem configuration: the first quadrupole acts as a mass filter to select a target ion, the second serves as a collision/reaction cell where selected gases (e.g., helium, hydrogen, or ammonia) are introduced to eliminate polyatomic interferences through collision-induced dissociation or reaction, and the third quadrupole filters the resulting product ions for precise detection. This design significantly enhances detection limits, selectivity, and reliability compared to single quadrupole ICP-MS systems, making it indispensable in applications requiring exceptional accuracy, such as environmental monitoring (e.g., trace metal analysis in water/soil), clinical and biological research (e.g., metallomics and biomarker studies), pharmaceutical quality control (e.g., elemental impurity testing per ICH Q3D guidelines), and advanced materials science (e.g., high-purity semiconductor analysis).

The global Triple Quadrupole Icp Ms market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
