Report Overview

Tritium battery is a nuclear battery that has a 20+ year lifetime of continuous power without needing a replacement or recharging. When the battery runs out of power, it decays to a stable state, which means no leftover nuclear waste. They perform like photovoltaic cells, which are semi conducting diodes, in which current flows when a photon strikes the diode junction, freeing an electron. In a betavoltaic cell, an electron, is generated by a small radioactive source (called betalight), which triggers the diode rather than a photon. This technology is essentially safe as the beta particles that the isotopes emit are very low energy and can be easily shielded.
