## Abstracts

Trivalent Split Influenza Vaccine is a preventive biological product, which is mainly used to prevent influenza virus infection. It contains three different influenza virus strains, a subtype of influenza A (H1N1), A (H3N2) and a type B influenza virus. These strains are cleaved so that they lose their infectivity but retain their antigenicity, which stimulates an immune response in the body and thus provides protection against the corresponding influenza strain after vaccination. This vaccine is usually given before flu season to reduce the risk and severity of flu infection.

The global Trivalent Split Influenza Vaccine market size was estimated at USD 5207.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
