Abstracts

Tropospheric Scatter System is a technology that uses the scattering effect of radio waves in the troposphere in the atmosphere to achieve beyond-line-of-sight communication. It transmits high-frequency radio waves (usually UHF or SHF bands), which are scattered when encountering uneven air masses in the troposphere, thereby achieving long-distance communication, with a coverage range of 300-500 kilometers or even farther. The troscatter system has the advantages of strong anti-interference ability, high reliability, and suitability for complex terrain. It is widely used in military communications, remote monitoring, oil and gas exploration and other fields.

The global Tropospheric Scatter System market size was estimated at USD 511.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
