### Report Overview

Floating and trunnion are the two most common types of ball valves. Floating ball valves are often used in industrial applications, while trunnion-mounted valves have a fixed ball and can be adjusted to regulate pressure. Both types can be used to control pressure in industrial and long-distance pipelines. The most important difference between these two design is the construction of the ball and the way in which it is assembled inside the valve body. A trunnion ball is attached and centred inside the valve body through both a top shaft -the valve stem- and a bottom shaft – the trunnion. A floating ball is attached to the valve body only through the valve stem. As a result, the floating ball “floats” in the valve seats.

The global Trunnion and Floating Ball Valves market size was estimated at USD 9410 million in 2023 and is projected to reach USD 14723.60 million by 2032, exhibiting a CAGR of 5.10% during the forecast period.
