Abstracts

TSV technology covers several core process steps: first, the TSV hole is precisely created using deep reactive ion etching (DRIE) technology; then, the dielectric layer is formed using plasma enhanced chemical vapor deposition (PECVD) technology; then, the barrier layer and seed layer are deposited by physical vapor deposition (PVD) technology to prepare for electroplating copper filling; then, the TSV hole is filled by electroplating copper (Cu) process; finally, chemical mechanical polishing (CMP) technology is used to remove excess metal to ensure the flatness of the structure. In addition, for the needs of 3D IC/Si integration, key steps such as wafer thinning and thin crystal bonding are also involved. TSV deposition equipment is an indispensable key equipment in semiconductor manufacturing. Its core role is to accurately deposit multiple thin film layers in the TSV manufacturing process. These thin film layers include insulating layers, barrier layers, and seed layers.

The global TSV Deposition Equipment market size was estimated at USD 1452.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
