Abstracts

A tube type radar reflector is a passive marine safety device designed to enhance the radar visibility of non-metallic or small vessels, such as kayaks, canoes, or sailboats, by reflecting incoming radar signals back to their source. Typically constructed from lightweight, durable materials like aluminum or plastic with an internal arrangement of metallic, corner-reflecting surfaces, these cylindrical devices are engineered to be compact, buoyant, and easily deployable or mountable. Their primary function is to increase the vessel's radar cross-section, thereby improving detection by other ships or coastal radar systems, especially in conditions of reduced visibility, and ultimately contributing to collision avoidance and navigational safety in maritime environments.

The global Tube Type Radar Reflector market size was estimated at USD 72.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
