Abstracts

The tuberculosis (TB) vaccine market primarily revolves around the Bacillus Calmette-Guerin (BCG) vaccine, which remains the only licensed vaccine for preventing tuberculosis, particularly severe forms in children, though its efficacy in preventing pulmonary TB in adults is variable and geographically inconsistent. This market is characterized by a high unmet medical need, especially in low- and middle-income countries with high TB burden, driving ongoing research and development efforts for next-generation vaccines aimed at improving efficacy, duration of protection, and suitability for diverse populations, including adolescents and adults. Key stakeholders include multinational pharmaceutical companies, biotech firms, non-profit organizations, and public health entities like the World Health Organization, with funding often supported by global health initiatives such as Gavi and the Stop TB Partnership. Market dynamics are influenced by factors such as government immunization policies, epidemiological trends, regulatory pathways, and the gradual progression of candidate vaccines through clinical trials, with a growing emphasis on novel platforms including viral vectors, protein subunits, and mRNA-based approaches to address the limitations of the century-old BCG vaccine.

The global Tuberculosis Vaccine Drug market size was estimated at USD 401.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
