Abstracts

Tubular ceramic membranes are specialized filtration devices consisting of porous, tubular-shaped ceramic materials?such as alumina, zirconia, or titania?engineered with precise pore sizes to separate particles, microorganisms, or macromolecules from liquids or gases via processes like microfiltration, ultrafiltration, or nanofiltration. These membranes are characterized by their mechanical strength, chemical and thermal resistance, longevity, and ability to operate under harsh conditions, making them suitable for demanding industrial applications where polymeric membranes may fail. Their structure allows for high flow rates and effective backwashing or cleaning, contributing to reduced fouling and extended service life in continuous or intensive processing environments.

The global Tubular Ceramic Membrane market size was estimated at USD 156.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.15% during the forecast period.
