### Report Overview

The tubular shuttle valve is a type of hydraulic or pneumatic valve that allows the fluid or gas to flow in two separate paths while maintaining a continuous supply to the output port. It consists of a cylindrical housing with multiple input and output ports and a sliding shuttle within the housing. The shuttle can be shifted between two positions to open one set of input and output ports while blocking the other. This valve design enables the diversion of fluid or gas flow without interrupting the supply to the output port. Tubular shuttle valves are commonly used in industrial applications where continuous flow and switching between multiple sources or systems are required, providing efficient and reliable control over fluid or gas distribution.
