Abstracts

Tumor embolization devices are specialized medical instruments designed to block or reduce blood flow to tumors, typically in vascularized organs such as the liver, kidneys, or brain, with the goal of starving cancerous tissues of oxygen and nutrients to inhibit growth or induce necrosis. These devices include embolic agents like microspheres, coils, particles, and liquid embolics, often used in minimally invasive procedures such as transarterial chemoembolization (TACE) or radioembolization (Y90). The market is driven by rising cancer incidence, advancements in interventional radiology, and the growing preference for targeted, less invasive treatments. However, it faces challenges related to procedural complexity, reimbursement policies, and the need for specialized training. Geographically, North America and Europe lead in adoption due to advanced healthcare infrastructure, while Asia-Pacific shows rapid growth fueled by increasing healthcare investments and awareness. Key players focus on innovation in biocompatible materials, precision delivery systems, and combination therapies to enhance efficacy and safety.

The global Tumor Embolization Device market size was estimated at USD 765.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
