Abstracts

Radiofrequency ablation (or RFA) is a procedure used to reduce pain. An electrical current produced by a radio wave is used to heat up a small area of nerve tissue, thereby decreasing pain signals from that specific area. A significant driver in the Tumor Radiofrequency Ablation market is the growing demand for minimally invasive and localized treatment options for various types of tumors, including liver, kidney, and lung tumors. Radiofrequency ablation offers a precise and effective approach to destroy cancerous tissue while minimizing damage to surrounding healthy tissue. However, a notable challenge in this market is the need for patient selection and treatment optimization. Ensuring that radiofrequency ablation procedures are tailored to individual patient needs and that optimal treatment parameters are established while addressing potential complications or tumor recurrence poses a significant challenge. Healthcare providers and manufacturers must focus on patient assessment, ongoing monitoring, and technological advancements to refine radiofrequency ablation therapies and improve patient outcomes in the battle against cancer.

The global Tumor Radiofrequency Ablation market size was estimated at USD 1896.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.60% during the forecast period.
