Abstracts

Tumour-induced osteomalacia (TIO) is a rare paraneoplastic syndrome characterized by renal phosphate wasting, hypophosphatemia, and impaired bone mineralization, resulting from typically small, benign mesenchymal tumours that overproduce fibroblast growth factor 23 (FGF23). These tumours, often located in soft tissues or bones and difficult to detect, lead to chronic phosphate depletion, causing muscle weakness, bone pain, and fractures. The condition's diagnostic complexity and the challenge of tumour localization contribute to significant delays in identification and treatment, which primarily involves surgical resection of the causative tumour for curative outcomes.

The global Tumour Induced Osteomalacia market size was estimated at USD 85.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Tumour Induced Osteomalacia market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
