Abstracts

Tunable mid-infrared (mid-IR) lasers are advanced optical devices capable of emitting coherent light within the mid-infrared spectral range, typically defined as wavelengths between 2 and 20 micrometers, while offering the ability to adjust or "tune" the output wavelength across a specific band. These lasers are critical in applications requiring precise molecular identification, as many molecules exhibit strong and unique absorption fingerprints in the mid-IR region. Key technologies enabling tunability include optical parametric oscillators (OPOs), quantum cascade lasers (QCLs), and difference frequency generation (DFG) systems, each offering distinct trade-offs in terms of tuning range, output power, and ease of operation. The defining characteristics of these systems are their spectral agility, high resolution, and ability to target specific molecular transitions, making them indispensable tools in scientific research, defense, industrial process control, and medical diagnostics.

The global Tunable Mid Ir Lasers market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
