Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Tuner and Demodulator Modules competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Tuner and demodulator modules are key front-end components used to receive, select and restore RF signal content in digital TV, broadcast reception, communication terminals and other devices. The tuner is responsible for selecting the target channel from the wide-band RF signal and converting it into a fixed intermediate frequency (IF) signal; the demodulator restores the modulation information (such as QAM, QPSK, OFDM, etc.) in the intermediate frequency signal to the original digital data stream (such as MPEG-2 TS). The two work together to form a complete signal reception link and are widely used in digital broadcasting systems such as DVB, ATSC, and ISDB. Modern modules are mostly highly integrated SoC or SiP forms with low power consumption, high sensitivity, and support for multiple standards.

The global Tuner and Demodulator Modules market size was estimated at USD 3354.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
