Abstracts

Tungsten alloy wear-resistant plate is an alloy plate composed of tungsten as the main hard phase and nickel, iron, copper, cobalt, molybdenum and other elements as bonding phases. It has excellent properties such as high strength, high hardness, high wear resistance, good heat resistance, corrosion resistance and low temperature impact resistance. The tungsten content in tungsten alloy wear-resistant plate is usually between 85% and 99%, which is the main hard phase in the alloy, providing wear resistance and hardness. Other elements such as nickel, iron, copper, cobalt, molybdenum, etc. are used as bonding phases to improve the strength and toughness of the alloy. The tungsten alloy wear-resistant plate has a tight structure, uniform organization, high carbide microhardness, and the surface hardness can reach a high level. At the same time, it also has good ductility and machinability.

The global Tungsten Alloy Wear Resistant Plate market size was estimated at USD 437.04 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
