Report Overview

A tunneled catheter (tunneled central venous catheter) is a catheter (thin tube) that is placed under the skin of a vein for long-term access. The catheter can be inserted through a peripheral vein or a proximal central vein, most commonly the internal jugular, subclavian, femoral, external jugular, or axillary veins. Tunneled catheters are more suitable for long-term use than non-tunneled catheters. Tunneled catheters can be left in place for weeks, months, or even years. As an advanced medical technology, tunneled catheters provide a safer, more convenient, and more comfortable solution for patients who require long-term infusions and treatments. Most people with tunneled catheters can carry out normal activities, such as work, school, and light exercise.
