## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Turbine Emergency Trip System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The turbine emergency trip system is the core safety protection device of the steam turbine generator set. It monitors key parameters such as overspeed, low lubricating oil pressure, large axial displacement, and excessive vibration in real time. When the parameters exceed the limit, the main steam valve and regulating valve are instantly closed to achieve emergency shutdown and prevent equipment damage and accident expansion. Its core design adopts "dual-channel redundancy" logic to ensure that the system can still operate reliably when a single component fails, and supports online testing without affecting the protection function.

The global Turbine Emergency Trip System market size was estimated at USD 175.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Turbine Emergency Trip System market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
